

State Immunization Investments

2019

Palau

\$441,986

Immunization Program Award Funding:
\$351,468

Other Funding: \$90,518

Vaccines are one of the most effective tools to protect the public's health and prevent disease. CDC supports state and local health departments to improve access to vaccines, build critical public health infrastructure, and strengthen the scientific evidence base for vaccine policy decisions and practices. CDC supports epidemiology and laboratory capacity to detect, prevent, and respond to vaccine-preventable diseases, including influenza and measles. CDC's investments save both lives and dollars.

Vaccinated children born between 1994 and 2018 will result in:

419
MILLION
illnesses prevented

\$1.88
TRILLION
societal costs saved

936
THOUSAND
deaths prevented

Supporting State Immunization Programs

\$351,468

Immunization Program Awards

Immunization program awards support the essential state public health immunization workforce, ensures program effectiveness, and scientifically sound immunization policy. A strong public health infrastructure at national, state, and local levels is vital to sustaining high vaccination coverage levels and low incidence of vaccine preventable diseases. Support also maintains public health preparedness for response to a vaccine-preventable national emergency, such as a pandemic or biologic attack.

Immunization program awards promote public awareness of vaccine recommendations, support the infrastructure to manage vaccine shortages, gather information and respond to outbreaks, recruit and educate networks of immunization providers, and provide continual quality assurance. These awards also include direct assistance to states to purchase vaccines for non-VFC-eligible, uninsured populations.

Strengthening Immunization Through Science and Innovation

CDC strengthens immunization science through support to public health departments, universities, and others. These investments include enhanced vaccine preventable disease (VPD) surveillance, epidemiologic and laboratory investments, vaccine safety monitoring and research, identification of new strategies to reach under-vaccinated populations; public awareness campaigns and resources; and provider education and tools.

\$90,518

Surveillance

Enhanced VPD Surveillance Activities: builds on established surveillance systems to provide more complete disease information. This improves CDC's understanding of why vaccine-preventable disease outbreaks occur, risk factors for disease, and our ability to respond to outbreaks when they happen.

New Vaccine Surveillance Network (NVSN): conducts active, population-based surveillance of pediatric infectious diseases and assesses the effectiveness of pediatric vaccines in the US. NVSN monitors changes in these germs and evaluates how many people get sick, information that is needed for the development and introduction of new childhood vaccines.
